

Your wish has come true!

The Omega Series - the world's first multimode microplate readers with a UV/Vis spectrometer

Your wish is our command. The new multifunctional POLARstar Omega microplate reader is the first to offer high speed, full spectrum absorbance measurements. For the greatest flexibility in microplate-based assays, four additional detection modes are also available: fluorescence intensity, time-resolved fluorescence, fluorescence polarization and luminescence. The new spectrometer technology allows full UV/Vis spectrum analysis from 220 to 850 nm at a

resolution of 1 nm. Read times faster than 1 second per well are possible. Simultaneous dual emission detection in fluorescence and luminescence modes completes the many features of the POLARstar Omega microplate reader.

Because of our continuous innovations, BMG LABTECH has become a world leader in microplate reading systems, offering a broad portfolio of solutions for your life science research. We hope to satisfy your wishes.
